PROJECT PLANNING, SCHEDULING, AND CONTROL IN CONSTRUCTION

AN ENCYCLOPEDIA OF TERMS AND APPLICATIONS

John Wiley & Sons Critical Path Method (CPM) and Performance Evaluation and Review Technique (PERT) are widely recognized as the most effective methods of keeping large, complex construction projects on schedule, under budget, and up to professional standards. But these methods remain underused because they are poorly understood and, due to a host of unfamiliar terms and applications, may seem more complicated than they really are. This encyclopedia brings together, in one comprehensive volume, all terms, definitions, and applications related to the time and cost management of construction projects. While many of these terms refer to ancient and venerable building practices, others have evolved quite recently and refer specifically to modern construction and management techniques. Sources include hundreds of professional books, trade journals, and research publications, as well as planning and scheduling software vendor literature. The detailed glossary of all applicable terms includes across-referenced listing of examples that describe real-world applications for each term supplied. An extensive bibliography covers all applicable books, articles, and periodicals available on project planning, scheduling, and control using CPM and related subjects. This book is an important quick reference and desktop information resource for construction planners, schedulers, and controllers, as well as civil engineers and project managers. It is also the ultimate research tool for educators, students, or anyone who seeks to improve their understanding of the management of modern construction projects.

INTEGRATED COST AND SCHEDULE CONTROL FOR CONSTRUCTION PROJECTS

Springer Science & Business Media Management and administrative processes within the construction industry have been undergoing major changes in the last several decades. These changes have involved significant adjustments in management science and management techniques, brought about by the need for contemporary valid information with which to manage the construction process. In short, management in the construction industry is changing significantly; change will continue at an accelerated pace at least through the next decade. The responses required of construction industry management are now resulting in a movement away from an entrepreneurial management style to professional management techniques and procedures. **THE COMPELLING ECONOMIC ISSUES** The issues forcing these changes are economic. The rising costs of construction and of money are forcing the buyers of construction services to be more demanding. Their demands are for more construction economies, more production, and more productivity than at any time in the past. Nowhere has this been more evident than in the Business Roundtable on construction and in the response of the construction industry to it. To be successfully responsive, management in the construction industry will be required to use the best project management methods available for cost control, schedule control, and for financial and accounting controls. But responsive professional management can survive and will flourish within this more demanding economic environment.

IFIP GLOSSARY OF TERMS USED IN PRODUCTION CONTROL

North Holland There is at present no universally accepted source giving definitions in English of the principal terms used in Production Control and in closely related areas. Most of the dictionaries and glossaries which do exist in this field fail to cover the full range of ideas which need to be considered during an intelligent discussion of the subject. Definitions given in different sources for Production Control terms differ not only in wording, but also in many cases in the concepts which they cover. The IFIP Glossary is intended to meet this perceived need, the immediate audience for the book being IFIP WG 5.7, the working group concerned with the automation of Production Management and other related subjects. The Glossary is organised in the following way: - The subject field was classified into sub-fields by Management function. - Each of these sub-fields was analysed to discover the main concepts with which it is concerned. - Terms were selected for each concept, using as far as possible terms which are already in common use. - Definitions were selected or written for each term. This approach of starting with subject classification is believed to be new in the field of production. Care has been taken to check the Glossary with the APICS dictionary (USA), and with British standards. Notes are included in Part 2 to explain the reasons for selecting a particular meaning for a term, in those cases where there are wide differences in the meanings chosen by different sources. Some consensus about the meaning of words is essential for communication. On the other hand, there is a danger that if the accepted framework of meanings is too rigid, it may hinder the future development of the discipline. It is hoped that a reasonable balance has been found between these conflicting influences. The Glossary should be useful not only to WG 5.7 members, but also to Engineers and Academics in all countries where a knowledge of English is important to industrial development.
