Algorithms for Obstetrics and Gynaecology

Oxford University Press, USA Algorithms in Obstetrics and Gynaecology presents the core knowledge needed to tackle all situations in obstetrics and gynaecology, in a structured fashion. All algorithms are designed to support rapid decision making in the most clinically relevant situations to minimise the risks of a poor outcome. A range of clinical problems are covered from common non-life-threatening emergencies such as hyperemesis in pregnancy, to life-threatening acute events such as ectopic pregnancy, acute fetal distress or maternal collapse. Each topic is presented as either an algorithm, a care pathway, or table of key information and has been carefully structured to ensure a logical progression of thought to aid anticipation, early diagnosis and prompt and appropriate management. Accompanying key learning points highlight the essential information from the topic. Based on current national guidelines and clinical evidence, the algorithms and care pathways can be used as a reliable and practical resource for day to day practice in obstetrics and gynaecology.

Obstetric and Intrapartum Emergencies

A Practical Guide to Management

Cambridge University Press **Obstetric and Intrapartum Emergencies** provides a comprehensive guide to treating perinatal emergencies before it is too late.

Essential Obstetric Practice

Springer Science & Business Media Advances in research, knowledge and clinical practice in all branches of medicine have been rapid over the past decades and the speed is accelerating. Thus, as we enter the 1980s the pressure on specialists is to concentrate on ever-narrowing fields of their science. For the research worker this is desirable, but the practising clinician Our patient is a whole can have

no clearly defined dividing lines. individual and every aspect of her makeup, physical and psychological, must always be taken fully into account. This is of vital importance in obstetrics and gynaecology. These two closely inter woven disciplines are branches of medical science in which emergency situations are not uncommon. Thus every practitioner, doctor, mid wife and nurse needs understanding of these subjects. Although technology advances rapidly, many basic principles remain the same. The chapters that follow deal with these, and modern trends in clinical management are discussed. For some decades the author has been in clinical charge of a maternity hospital some 12 miles south of Central London. The hospital is a training school for obstetricians and midwives, and the local population is adequately supplied with a general practitioner service. These circumstances are of some relevance because many views expressed are based on personal experience while others are based on countless books, articles, congresses and discussion with colleagues. To every source of information I express my thanks.
