Metonymy and Language

A New Theory of Linguistic Processing

Routledge Metonymy and Language presents a new theory of language and communication in which the central focus is on the concept of metonymy, the recognition of partial matches and overlaps. Through the use of original data sets and rigorous primary research, Denroche characterizes metonymy as key to understanding why language is so 'fit for purpose' and how it achieves such great subtlety and flexibility. This study develops the notion of 'metonymic competence' and demonstrates that metonymic behavior is often pursued for its own sake in recreational activities, such as quizzes, puzzles and play, and shows the possible impact of the application of metonymic processing theory to professional fields, such as language teaching and translator training. Furthermore, it proposes a research approach with metonymy at its center, 'metonymics,' which Denroche suggests could provide a powerful framework for addressing issues in numerous fields of practice in the arts and sciences.

Magic in the Air

Mobile Communication and the Transformation of Social Life

Routledge In this timely volume, James E. Katz, a leading authority on social consequences of communication technology, analyzes the way new mobile telecommunications affect daily life both in the United States and around the world. Magic in the Air is the most wide-ranging analysis of mobile communication to date. Katz investigates the spectrum of social aspects of the cell phone's impact on society and the way social forces affect the use, display, and re-configuration of the cell phone. Surveying the mobile phone's current and emerging role in daily life, Katz finds that it provides many benefits for the user, and that some of these benefits are subtle and even counter-intuitive. He also identifies ways the mobile phone has not been entirely positive. After reviewing these he outlines some steps to ameliorate the mobile phone's negative effects. Katz also discusses use and abuse of mobile phones in educational settings, where he finds that their use is eroding students' participation in class even as it is helping them to cheat on exams and cut class. Parents no longer object to their children having mobile phones in class in a post-Columbine and 9/11 era; instead they are pressing schools to change their rules to allow students to have their phones available during class. And mobile phone misbehavior is by no means limited to students: Katz finds that teachers are increasingly taking calls in the middle of class, even interrupting their own lectures to answer what they claim are important calls. In keeping with the book's title, Katz explores the often overlooked psychic and religious uses of the mobile phone, an area that has only recently begun to command scholarly interest. Magic in the Air will be essential reading for communications specialists, sociologists, and social psychologists.

Energy Use of Set-top Boxes and Telephony Products in the U.S.

The goal of this investigation was to estimate the 1999 energy consumption of set-top boxes and telephony products in the U.S. residential sector. Results of this study will be used to identify new energy conservation opportunities and to align programs with those opportunities. We conducted a bottom-up analysis for set-top boxes and telephony products using our own power measurements and stock and

usage estimates from secondary sources. The most common set-top boxes in U.S. homes in 1999 were analog cable boxes, digital cable boxes, wireless receivers, and game consoles. According to these measurements, analog cable boxes and wireless receivers draw between 10 and 15 watts, while digital cable boxes draw between 20 and 25 watts in both the Active and Standby modes. Video games used less than 2 watts in Standby mode, and about 8 watts when Active. We estimate that set-top boxes accounted for 0.7% of residential electricity use in 1999. Our investigation of telephony products included answering machines, cordless phones, cordless phone answering machine combination units, and mobile phone chargers. Answering machines, cordless phones, and combination units use between 2 and 3 watts in both the Active and Standby modes. Mobile phone chargers use about 1 watt in standby. We estimate that these telephony products account for 0.5% of U.S. residential electricity consumption. Together, set-tops and telephony constituted 1.2% of U.S. residential electricity consumption in 1999. Standby power use accounted for about 60% of this energy use. The combined total energy use of the products investigated for this study and those researched previously for this series of reports account for about 6.6% of residential electricity use in the U.S.

In other words, taking people, eventually all of the people on earth, and turning them into mechanically altered, perfect, human beings. That is what Drew previously found out happened to her. But, although Drew, Jessica and Michael know that they need to somehow stop the creators, Drew also knows that she's made another enemy along the way; one possibly even more dangerous than the creators. Friendship and Happiness

And the Connection Between the Two

McFarland This philosophical and sociological look at friendship and happiness begins with a review of Aristotle's three categories of friendship—friends of utility, friends of pleasure and friends of the good. Modern variations—casual friends, close friends, best friends—are described, along with the growing phenomena of virtual friendships and cyber socialization in the Internet age. Inspired in part by Bertrand Russell's The Conquest of Happiness, the authors propose that conquering unhappiness is key to achieving the self-satisfaction Russell called zest and Aristotle called eudaimonia or thriving by our own efforts.

Fine Grained Location Using Mobile Augmented Reality

With the growing acceptance of multimedia and the Internet, mobile phones are becoming multi-purpose information appliances, incorporating everyday services such as telephone, fax, answering machine, television, chat, games, internet browsing, GPS navigation etc. These mobile devices can now replace the functions of the head mounted displays making augmented reality applications accessible to users on their mobile phone. Augmented Reality has started spreading among people with applications of games, sports, tourist places, shopping and even in viewing things which appear invisible in walls. There are number of electrical cables, water pipes, vents passing over, behind a wall. Sometimes when you need to set up new electrical cables or new water pipes connection inside your wall one needs to figure out the existing circuitry of cables and structure of water pipes before piercing a hole. At some places there are large bunch of electrical cables running over while in some places there are number of water pipes there is no such standard for infrastructure of a building. It depends on area and usage number of things that are structure inside wall. One such example is complicated wire mesh in Boeing aircraft. The electrical assembly of aircraft is highly complex which thousands of cables running through it. Using the augmented reality technique, we can view the infrastructure inside wall for that particular wire which is in reality invisible as it hides behind the wall. This thesis shows how to integrate 3-D virtual objects into a 3-D real environment in real time. It describes the

visualization and planning at different places in a home or offices or any places you may visit. We use Qualcomm's Augmented Reality SDK (QCAR) for a mobile device. In this method, we show that a number of 3D virtual walls with a certain scale are stored as an Image Target in an application. The 3D view shows wires, pipes, vents and other infrastructures inside the wall. Thus, we provide a very effective and intuitive way of "annotating" reality.
